Serafim Kaisin, Nhung Ho*

Ultra-Diffuse Galaxies - what are they?

- “New” : firstly observed 2015, van Dokkum et al., 47 UDGs
- not a misnomer:

dwarfs : $M_{\star} \sim 10^7 - 10^8 M_{\text{sun}}$ $\rightarrow \mu_{g,c} \sim 26 \text{ mag/arcsec}^2$
diffuse : $R_e \sim 1.5 - 4.5 \text{ kpc}$
- probably Dark-Matter dominated in order to be long-lived in cluster environments
- Milky-Way sized galaxies with the (stellar) mass of small dwarf-Ellipticals !!

van Dokkum+15:

- 47 objects overlapping the Coma cluster
- no redshift distances
- but stars not resolved even with HST/ACS

UDG Globular Cluster (GC) population

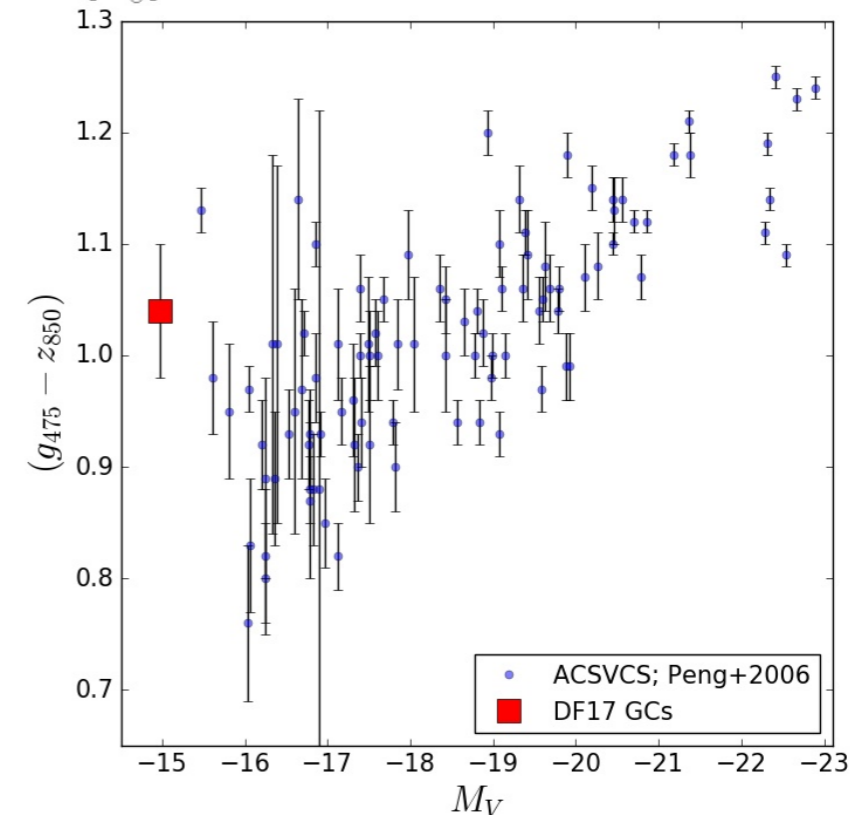

- Beasley & Trujillo (2016): “DF27”

→ $N_{GC} = 27 \pm 5$

→ high specific GC frequency

→ $M_{DM} \sim 10^{11} M_{sun}$, $f_{DM} \sim 1000$

UDG Globular Cluster (GC) population

- Beasley+16:
VCCI28

UDG Globular Cluster (GC) population

- Beasley+16: VCC128
- also high specific GC frequency
- $M_{\text{DM}} \sim 10^{11} M_{\text{sun}}$, $f_{\text{DM}} \sim 1000$
- in Re, $f_{\text{DM}} \sim 100$ (cf. van Dokkum+16)

- “DF44”:
 $N_{\text{GC}} \sim 100$ (!)
- $M_{\text{DM}} \sim 10^{12} M_{\text{sun}}$
(MW!)
- in Re, $f_{\text{DM}} \sim 50$

Another UDG: DGSAT-1

- first UDG with confirmed distance (78 Mpc, redshift): hence confirmed size & luminosity
- first data collected with:
 - 15-cm aperture refractor, 43800s exposure time
 - 40-cm Newton telescope, 13200s exposure time
- original purpose: search for M3 I dSphs
- no stars resolved in follow-up Subaru V,I-band images!

← | | arcmin →

← | | arcmin →

Follow-up observations of DGSAT-I

- Subaru SuprimeCam images in V+I band from the SMOKA archive, 7000s total integration time
→ no stars resolved at 0.6" resolution!
- slit spectroscopy: SCORPIO spectrograph on the 6-m BTA telescope of the SAO RAS
total 25200s, coverage 3700-5500Å, resolution 5Å
- H α narrow-band imaging

Results

- $V_h = 5450 \pm 40$ km/s $\rightarrow V_{LG} = 5718 \pm 40$ km/s
 - \rightarrow Hubble distance 78 Mpc
 - \rightarrow association with an outer filament of the Pisces-Perseus supercluster
 - \rightarrow but isolation is also possible

Photometric analysis

- important and difficult:
complete masking and precise background subtraction
→ multi-step masking and object detection
- use GALFIT to fit a Sersic profile
- no background component to reduce degeneracy
- optionally fit central-offset overdensity (bar?) with separate component, or mask it (?)

Photometric analysis: GALFIT

Photometric analysis: GALFIT

quantity	value
Right Ascension	01h 17m 35.59s
Declination	+33° 31' 42'' 37
radial velocity	5450 ± 40 km s ⁻¹
apparent magnitude	18.5 (SDSS <i>g</i> -band)
	17.7 (SDSS <i>i</i> -band)
central surface brightness	25.0 mag arcsec ⁻² (<i>g</i> -band)
	24.4 mag arcsec ⁻² (<i>i</i> -band)
luminosity	3.6 × 10 ⁸ L _{⊙,<i>g</i>}
	3.5 × 10 ⁸ L _{⊙,<i>i</i>}
<i>g</i> − <i>i</i> color	0.9
central <i>g</i> − <i>i</i> color	0.6
effective radius (<i>R_e</i>)	4.7 ± 0.5 kpc
axis ratio (<i>b/a</i>)	0.9
Sérsic index (<i>n</i>)	0.6
mass-to-light ratio (<i>i</i> -band)	0.8 M _⊙ /L _{⊙,<i>i</i>}
stellar mass	2.9 × 10 ⁸ M _⊙
gas mass (HI)	< 5.8 × 10 ⁸ M _⊙
SFR	< 0.003 M _⊙ yr ⁻¹
sSFR	< 6 × 10 ⁻¹¹ yr ⁻¹

Diffuse galaxies

Diffuse galaxies

DGSAT-I

Color (V-I) : central offset overdensity is ~ 0.4 mag bluer !

Color (V-I) : central offset overdensity is ~ 0.4 mag bluer !

Koda+15 (arXiv:1506.01712): 800 (!) UDGs in Coma

Koda+15 (arXiv:1506.01712): 800 (!) UDGs in Coma

Martinez-Delgado et al. (in prep.)

Ongoing / Future Work

- spatially resolved spectroscopy (e.g., MUSE proposal) to get:
 - kinematic structure, especially ROTATION
 - (inner) mass profile, esp. DM profile
 - stellar population (incl. gradient)
- Globular Cluster kinematics for DM halo mass/profile
- GC counts and metallicities (formation, accretion/mergers?)
- improve Numbers of analyzed UGDs

Summary

- UDGs may be very ubiquitous and contribute significantly to the faint galaxy population
- Dark Matter content unclear at the moment but likely high
- still need to find a consensus formation model
- more to come soon, including resolved spectroscopy (but hard!)
