

Future LSS surveys with eROSITA and 4MOST

Rosati, Norman, Borgani 2002

Alexis Finoguenov

X-ray cluster identification

Point source+by eye BCS, REFLEX, NORAS, MACS	Point source+optical survey CODEX, RASSinDES
Extended source+by eye RDCS, 400 sq.deg., SPT	Extended source+optical survey COSMOS, CDFS, AEGIS, SXDF, XMM-XXL

Galaxy clusters: status (1 yr ³/₄)

Status 2016-03-29 (CODEX)

1942 candidates richness > 10

- 1307 $N_{spec} > 3$
- 754 $N_{spec} > 10$
- 427 $N_{spec} > 15$

Of them: 1600/1942 completed

- 1051 $N_{spec} > 3$
- 630 $N_{spec} > 10$
- 369 $N_{spec} > 15$

Rich clusters seems fine

Cosmology from richness function

This is intermediate results, used to produce covariance matrix

Mapping the structure of the hot Universe:

Requirements

Detect 100.000 Clusters of Galaxies

- ✓ All-sky survey sensitivity 6×10^{-14} erg/cm²/s
- ✓ Deep survey field(s) (~ 100 deg²) to 1×10^{-14}
- ✓ Individual pointed observations
- ✓ Moderate angular resolution ($< 30''$ aver. over FoV)
- ✓ Large collecting area (> 2000 cm² @1keV)
- ✓ Large FoV (1° \emptyset)
- ✓ Long duration survey: 4 years $\leftarrow \rightarrow$ 1/2 year (ROSAT)

The eROSITA telescope

Telescope structure

www.mpe.mpg.de/eROSITA

Focal length 1.6 m
F.o.V. = 0.81 sqdeg
Total weight ~800 kg

7 identical telescopes (Wolter-I/ pnCCD-cameras)
Energy range: 0.3-8 keV
Energy resolution: ~136 eV @ 6 keV
Effective Area: ~1400 cm² (@1keV)
PSF: 15" onaxis

eROSITA Hardware

Friedrich et al, 9144-185

Fürmetz et al, 9144-192

Effective Area and Grasp

- Effective area at 1keV comparable with XMM/Newton @ 1 keV
- Factor ~7-8 larger surveying speed
- 4 years dedicated to all sky survey (with estimated 70-80% efficiency)

A fast survey machine

Chandra

$Z \sim 0.06$

~30 pointings

~2 Msec

[0.5" HEW]

eRosita

~1 pointing

~80 ksec

Wide-area census of galaxy clusters (10^5) and active galactic nuclei (10^6)

RG: Mission timeline

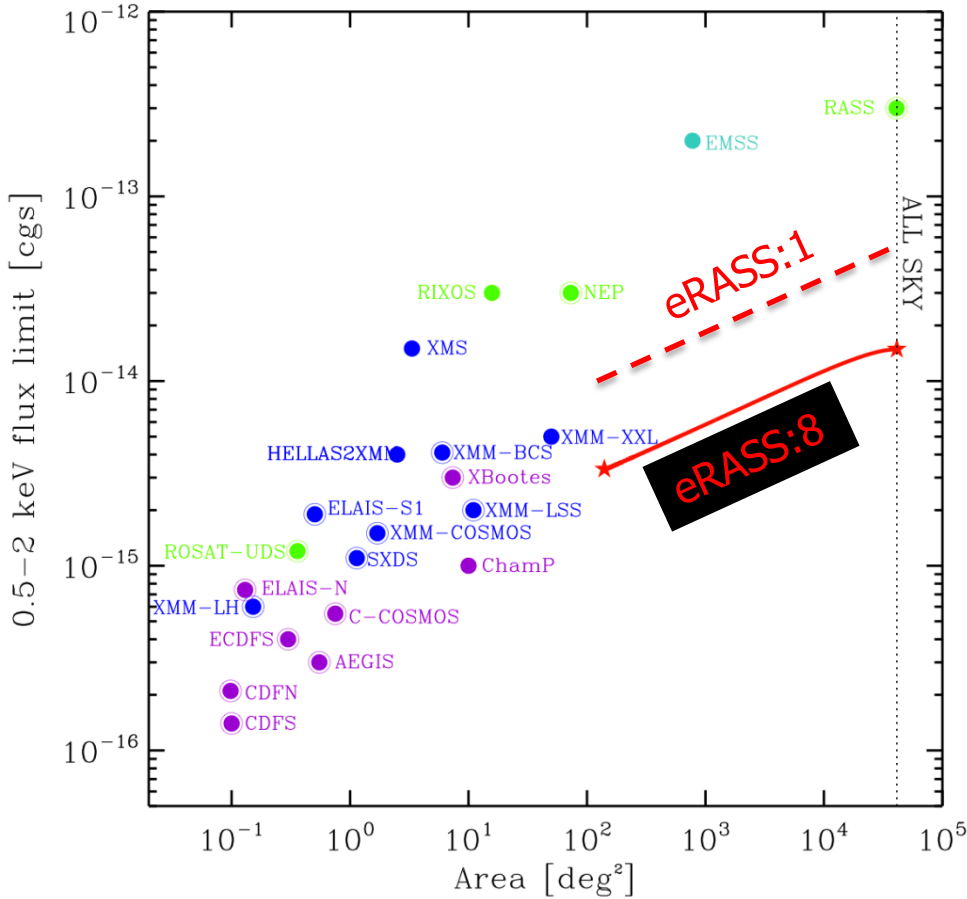

- **eROSITA delivery to Russia:** Q4 2016
- **Launch readiness:** December 2017 from Baykonour (Zenit+Fregat)
- **3 Months:** flight to L2, PV and calibration phase
- **4 years:** 8 all sky surveys eRASS:1-8 (scanning mode: 6 rotations/day)
- **3.5 years:** pointed observation phase, including ~20% GTO. 1 AO per year

eROSITA surveys in context

Point sources sensitivity

All sky: 10^{-14} (0.5-2 keV)
 2×10^{-13} (2-10 keV) [erg/cm²/s]

Extended sources sensitivity

All sky: 3.4×10^{-14} (0.5-2 keV)

Merloni et al. 2012

eROSITA cosmology forecast

Pillepich, Borm, Reiprich, Porcianni

Results for

- ▶ cluster abundance + clustering
- ▶ optimistic cases
- ▶ w CDM-cosmology

Data	$\Delta\sigma_8$	$\Delta\Omega_m$	Δw_0	Δw_a
<i>eRASS:8</i>	0.011	0.008	0.091	0.36
<i>eRASS:8</i> +Planck	0.007	0.006	0.071	0.27

Spectroscopic follow-up

- **North: SDSS IV/SPIDERS (2014-2020), SDSS V proposal**
 - ~8,000 redshifts of RASS & XMMSL AGN (adding in ~10k SDSSI,II,III, almost complete follow-up of $r < 17$ RASS sources) + 4,000 Clusters
 - eROSITA follow-up over a ~1500 deg² area in the NGC: reach >80% completeness for eRASS:4 (~35,000 spectra)
- **South: VISTA/4MOST (2021-2026)**
 - Complete, systematic follow-up of both Clusters and AGN from eROSITA: reach >80% completeness for eRASS:8
 - ~1M galaxies in ~50k X-ray selected clusters (Cluster clustering, RSD, velocity dispersion)

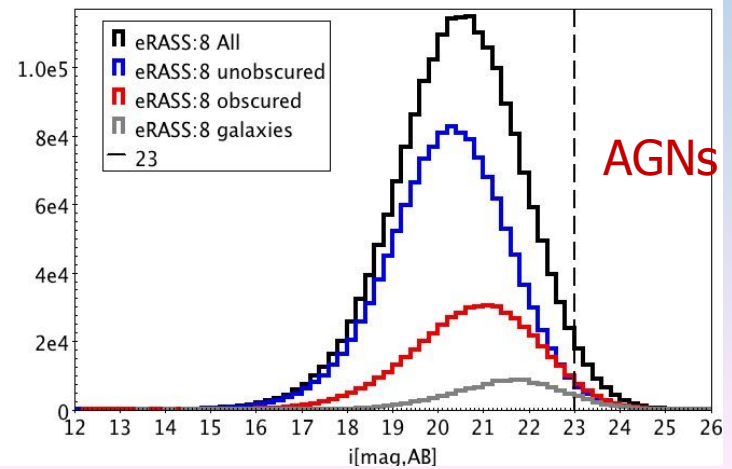

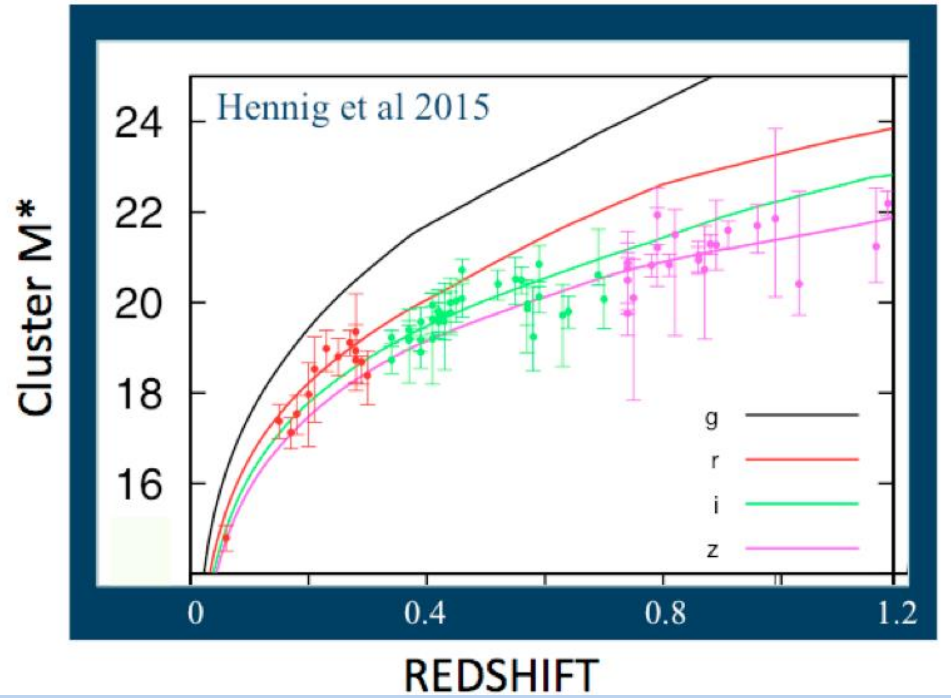

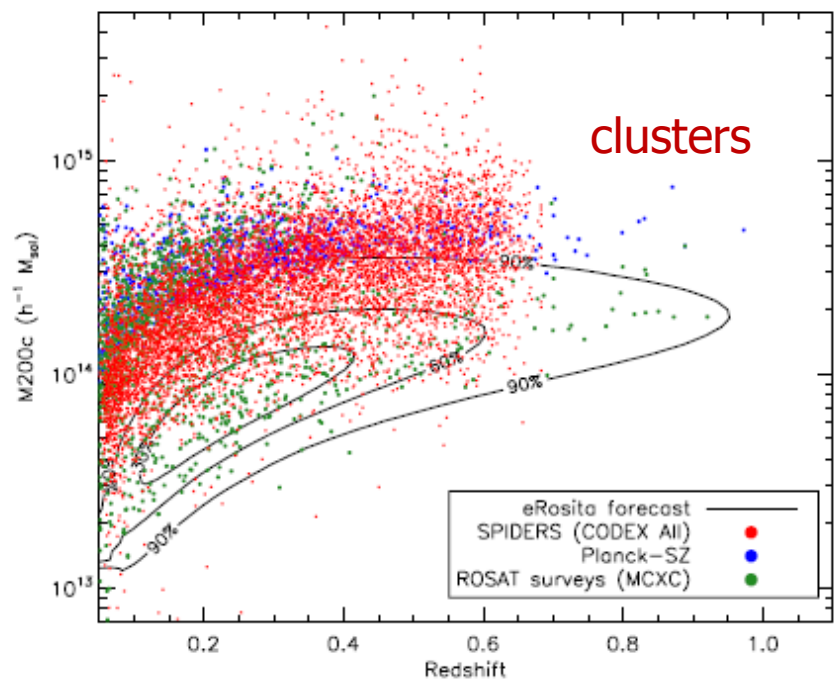

Facility

Limiting m_{AB} [mag, point source]

KABS

FINAL KABS areas

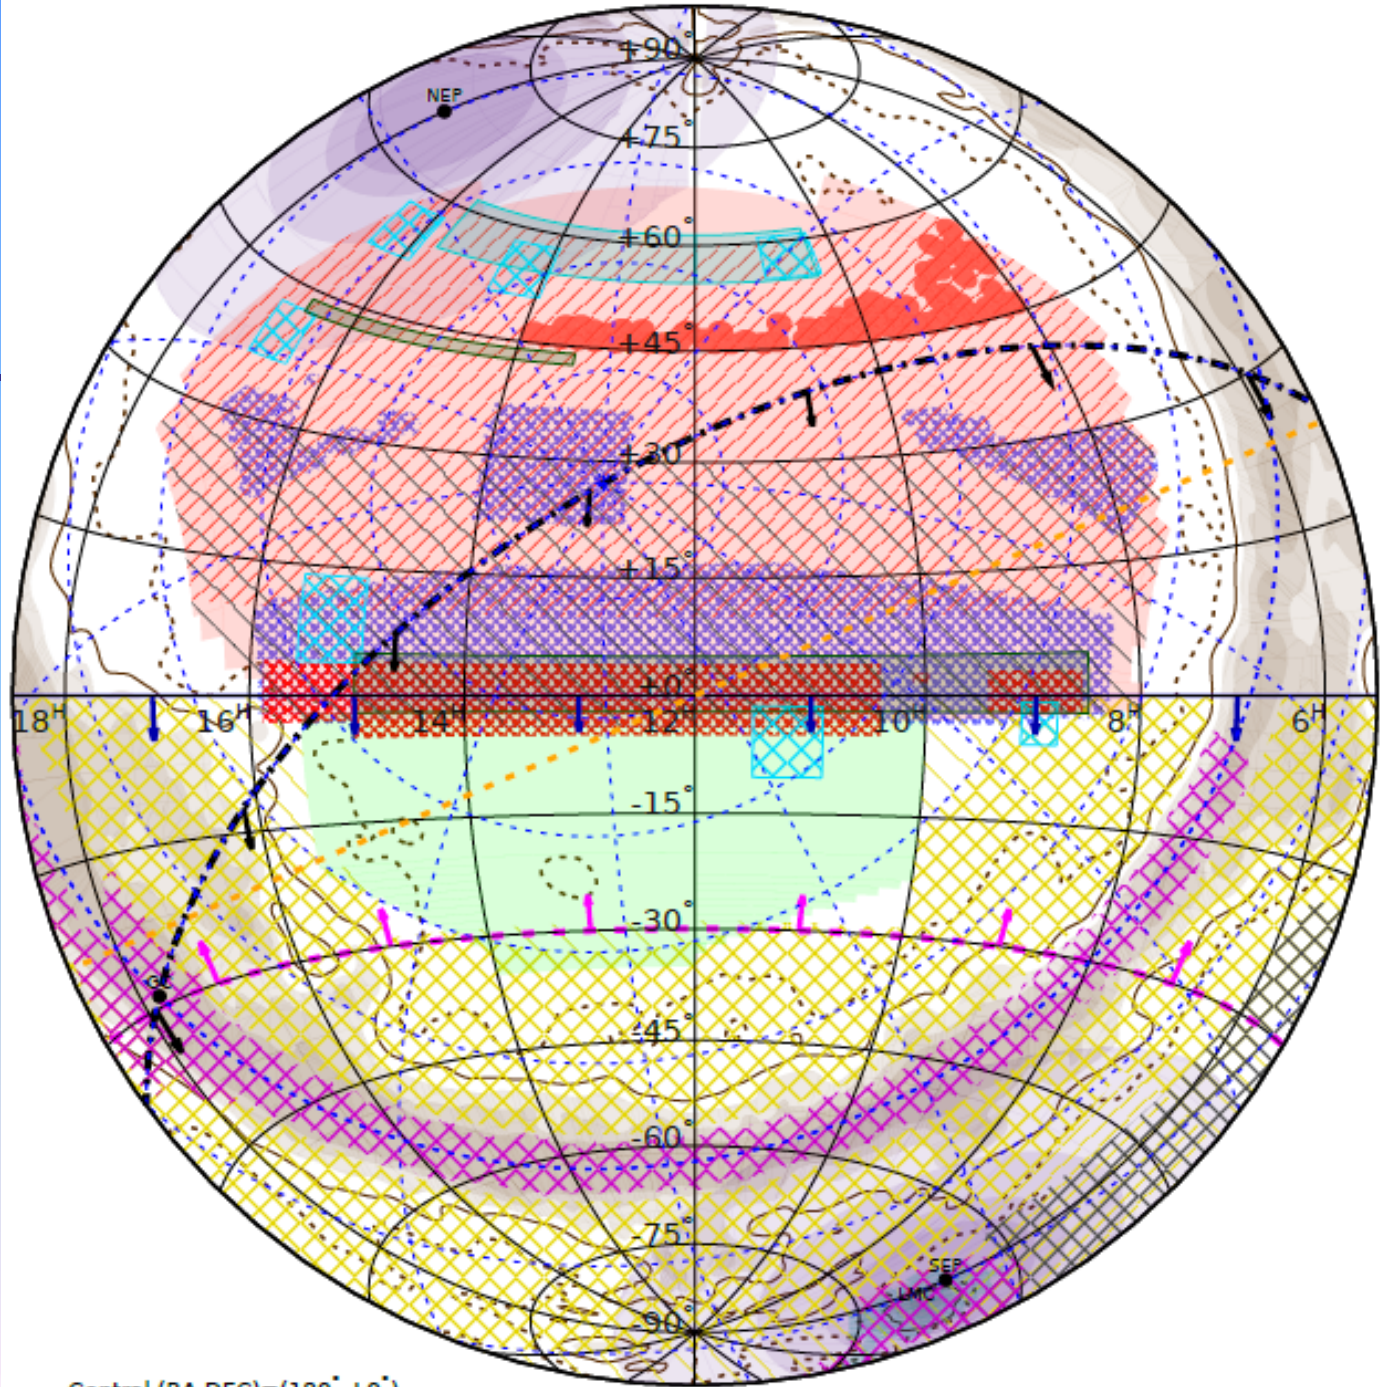

- F1 10.5h<RA<15.0h -30<DEC<-42 (~450deg²) DECCam
F2 18.5h<RA<20.4h -42<DEC<-60 (~450deg²)
F3 6.0h<RA< 7.5h -30<DEC<-60 (~200deg²)
-----> ~1100deg²
F4 8.0h<RA<10.0h -20<DEC< 0 (~600deg²) DECCam

Conclusions

- X-ray cluster catalogs have long history, achieving impressive depths and redshift
- SDSS allowed us to complete the cluster cosmology of RASS
- Extended source selection is most promising for robust cosmology
- Huge improvement is expected from eROSITA in 2020s.
